Machine Test 05 – Process Management

Objectives

1. Display the currently logged-in user.

2. Display the processes running in the current terminal session.

3. Display all running processes with detailed information.

4. Find all Bash shell processes running on the system.

5. Install the htop package.

6. Launch htop and verify that CPU and Memory usage are visible.

7. Open a new terminal and create a process that runs for 5 minutes.

8. Search for the process created in Step 7.

9. Identify the PID of the process.

10. Open the real-time process monitoring tool and observe running processes.

11. Terminate the process created in Step 7 using its PID.

12. Verify that the process has been terminated successfully.

13. Create another process that runs for 10 minutes.

14. Find the PID of the new process.

15. Forcefully terminate the process using the appropriate command.

16. Verify that the process is no longer running.
